1. There is no search bar in implementation screen. Definitely we need it. Also I will place the bar above the table and use angular to do the search.
2. In design screen, it's using "other" tab to stand for searching non-alphabetical character but in implementation screen it's using "#". I like other better, because it's catching and clear to users. Also font size in design screen is bigger.
3. There is a border on left side in design screen, but in implementation screen it's on the right side also with gradient.
4. The user pagination is on the right side, but in implementation screen it's on the left side. Also in implementation screen, there is a next page arrow which not in design screen. I don't think it's necessary but it's ok to have it.
6. The joined date format is different. In design page it's using how many weeks ago, but this method is not implemented in implementation screen. I think it's clear for user to check last joined date if using the design screen's format.
7. The row width is different.
8. Font color in design screen is darker than implementation screen.
